

ABSTRACT

The present invention relates to methods for preparing a candy having a
5 stereoscopic picture therein comprising the step of pouring a measured amount of the
first mixture, prepared by dissolving and concentrating the raw materials, for candy into
a mold, while a temperature of the mixture is maintained at of about 130 to 150°C;
partially cooling the first mixture at about 30 to 45°C of its surface temperature;
printing desired pictures by using a pad printing method with one or more of black,
10 yellow, red, and blue edible ink compositions onto the mixture at a temperature of about
15 to 25°C and a relative humidity of 40 to 60%, and then drying the mixture; pouring a
measured amount of the second mixture, prepared by dissolving and concentrating the
raw materials, for candy into the mold atop the first mixture, while a temperature of the
second mixture is maintained at about 120 to 135°C; and cooling the resulting mixture.
